

Step by step

# MANUAL FOR CONSTRUCTION AND OPERATION OF **BIOCLIMATIC CELLAR**

## INTRODUCTION

One of the main revenue sources for rural populations in Sugd province is growing and selling fruits and vegetables. Unfortunately, this business is seasonal. During harvest, farmers sell their crops for a very low price. Farmers can, however, store their crops in a Bioclimatic Cellar and sell their harvest for a profit.

In accordance with findings from surveys conducted among residents of jamoats, rural populations store their crop in the traditional way. The harvest is stored in empty barns or underground, such as in wells. Such storage areas, which contain a high level of humidity, do not protect the crop from a cold wave. This results in a waste of 30-40% of crop.

To solve the above mentioned problem, GERES developed a design for bioclimatic cellars for farmers. This manual gives detailed information about the construction and operation of bioclimatic cellars. In such bioclimatic cellars, farmers can store vegetables, such as potatoes, onions, beets and turnips as well as fruits, such as apples, quinces, and pears. Farmers then will be able to sell their crops in winter for higher prices thus increasing their household income.

## TABLE OF CONTENTS

# 1. BIOCLIMATIC CELLAR

*...Is used for storing fruits and vegetables clean and fresh for longer period.*

For rural residents, whose main source of income is from growing and selling fruits and vegetables, French organization GERES offers construction of bioclimatic cellars, which are adapted to our climate and can be used in Afghanistan and India as well.

Bioclimatic cellars from GERES are different from traditional cellars because of their added hallway

and ventilation windows and pipes, which are important for air circulation.

Walls of such underground construction are built from stones and ventilation pipes are made from plastic. It is important to note that ventilation system inside the cellar operates without any fan or any engine which is a bonus for possible times of energy crisis. The volume and size of a

bioclimatic cellar depends on the farmers' financial resources and amount of crop being stored.

---

*This manual provides information for three types of bioclimatic cellar:*

- 1. 5.2 m x 4.2 m – for storing 4 tons of potatoes*
  - 2. 7.8 m x 4.2 m - for storing 10 tons potatoes*
  - 3. 10.8 m x 4.2 m - for storing 20 tons of potatoes.*
-

## 2. CONSTRUCTION OF A BIOCLIMATIC CELLAR

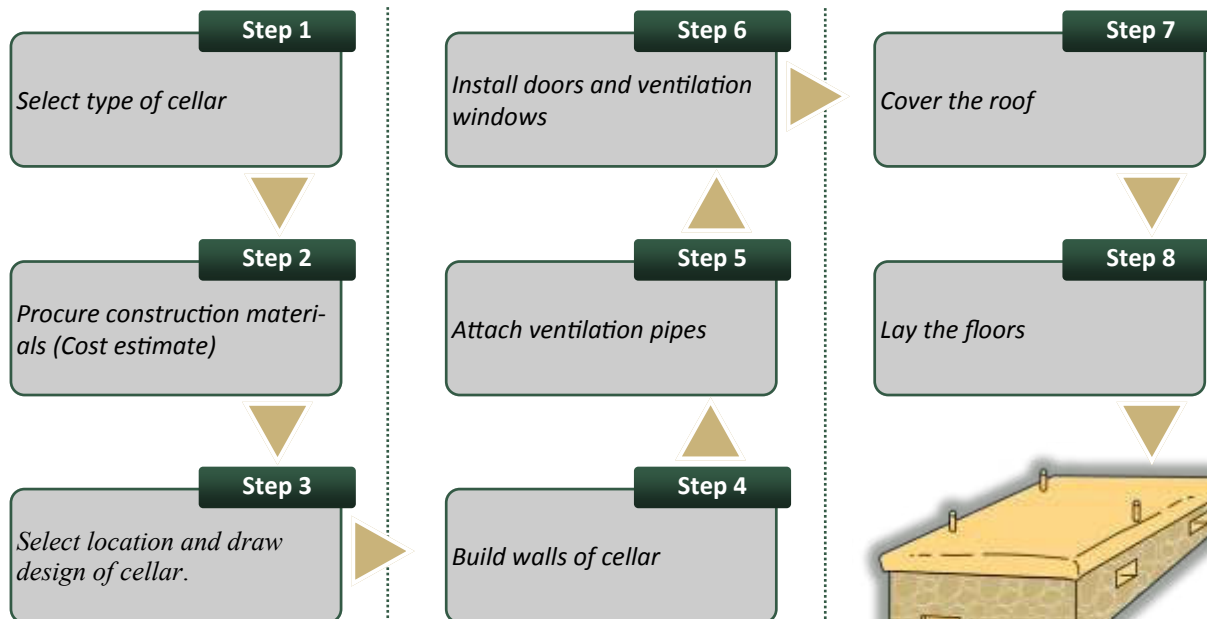

*Following all the steps during construction guarantees successful operation of your bioclimatic cellar.*

### Principles for operation of bioclimatic cellar

1. The underground cellar stores produce at a moderate temperature year round.
2. Provide humidity in the air through:
  - a) permanent ventilation of air (through ventilation pipe);
  - b) Temporary ventilation of air (through ventilation windows).

To take advantage of these principles, follow the steps outlined below:

By following these steps you can construct a bioclimatic cellar.

## 2.1. SELECTING TYPE OF CELLAR

When deciding which type of cellar you would like it is important to take the following factors into consideration:

- How much money do you have in your budget?
- Do you have enough space for constructing a cellar?

If you have all the required resources and space, then select one of the types of cellar described below.

Depending on volume and size, a bioclimatic cellar can be of three types::

### For 4 ton crop

**Size:** 5.2m x 4.2m.

**Volume:** for storing 4 tons of potatoes

**Price:** 13165.78 TJS

### For 10 ton crop

**Size:** 7.8 x 4.2m.

**Volume:** for storing 10 tons of potatoes or 7 tons of apples

**Price:** 17230.67 TJS

### For 20 ton crop

**Size:** 10.8 x 4.2m.

**Volume:** for storing up to 20 tons of potatoes

**Price:** 21937.04 TJS

## 2.2. PROCURING CONSTRUCTION MATERIALS (COST ESTIMATE)

**For construction of bioclimatic cellar procure the following materials:**

- Stone; (for top of the door and ventilation windows);
- Sand;
- Cement;
- Gravel
- Soil;
- Plastic pipes with 100mm diameter;
- Plastic elbow for pipe with 100mm diameter;
- Glue for plastic pipes;
- Cap for ventilation pipe ;
- Plank with 3cm x 10cm x 6m size
- Plank for door and window frame;
- Batten 5cm x 5cm (for terrace);
- Galvanized sheet;
- Hinge
- Handle
- Lock
- Lock with hinges
- Nails

***If you construct the Bioclimatic Cellar using your own labor you can save money. Otherwise you must include the cost of hired labor in your budget.***

**Required materials and costs are shown in the next pages.**

**For 4 tons**

Step 3

## 2.3. SELECTING LOCATION AND DRAWING DESIGN OF CELLAR

After you have selected the type of cellar you want and procured all the needed construction materials, select a location where you will construct it and draw its design. While selecting location, it is recommended to consider the following factors:

Construct the Bioclimatic cellar away from humid areas, as humidity will cause produce to rot. Farmers may only build a cellar on land which is explicitly legally their own.

Designs for each type of bioclimatic cellar are shown in the next pages.

Because the three sizes of cellars all have the same depth, height, and width, the cross sections of cellar height and depth on the next 3 pages feature a 4 ton cellar, but can also be used in the design of a 10 and 20 ton cellar.

## DESIGN OF BIOCLIMATIC CELLAR FOR 4 TONS CROP

For 4 tons

Size:  
5.2m x 4.2m

### CROSS SECTION A-A

### For 4 tons

Size:  
5.2m x 4.2m

## CROSS SECTION B-B

For 4 tons

Size:  
5.2m x 4.2m

For 10 tons

Size:  
7.8m x 4.2m

## DESIGN OF BIOCLIMATIC CELLAR FOR 10 TON CROP

# DESIGN OF BIOCLIMATIC CELLAR FOR 20 TON CROP

For 20 tons

Size:  
10.8m x 4.2m

Step 4

## 2.4. BUILDING THE WALLS OF THE CELLAR WITH A HALLWAY

**Methodology of building walls for cellar for 4 tons crop is shown as example.**

1. First, excavate the land of selected location 180cm deep from above the ground.

2. Then, build the base of the wall from stone, as shown in the picture. The base should be 60cm thick.

3. Lay a stone wall starting at a depth of 180cm and build the wall until it is 1m tall above the ground.

4. While building the wall, leave a place for the ventilation pipe.

5. The hallway will help keep the air inside the cellar at moderate level. It won't let the cold wind enter the cellar.

Step 5

## 2.5. ATTACHING VENTILATION PIPES

**Ventilation pipes serve as a permanent ventilation system.**

1

Attach plastic pipes with 100mm diameter to the side walls from bottom up.

2

The same size of pipes will be placed under the plaster floor.

3

Leave 65 cm intervals between pipes on the floor.

4

Make a hole in the upper part of the pipes on the floor with 42 cm intervals between each hole.

5

In each pipe, make 7 holes. Diameter of each hole is different from the others. Hole on elbow side is 10mm and at the end part, 20 mm. (see in the picture).

6

Then attach the floor and wall pipes by plastic elbow with 100mm diameter.

Step 6

## 2.6. INSTALLING DOORS AND VENTILATION WINDOWS

*Windows serve as an additional ventilation system.*

- ① For a 4 ton cellar, install 1 window. For 10 and 20 tons cellar, use 2 windows. Use wooden double glazed windows with size 70cm in width and 50 cm in height to open.

- ② The cellar should have 2 doors:  
a) for entrance to hallway;  
b) for entrance to cellar.  
Doors are made from planks with size 175cm x 90cm.

Step 7

## 2.7. ROOFING THE CELLAR

- ① To start the roof, put the wooden beams with 18-20cm diameter over the wall. Leave 72cm-intervals between them
- ② Then, cover the planks with smaller planks, each 3cm thick. (in some cases, you may also use thin tree branches.
- ③ Cover the 3cm plank layer with one layer of ruberoid (hydro insulation material) or plastic sheet to protect the cellar from rain and water.
- ④ For insulation, cover the ruberoid or the plastic sheet with a 10cm thick layer of reeds
- ⑤ After having covered the roof with reeds, plaster it with 10cm of soil.
- ⑥ Plaster the final layer with a mixture of mud and hay. Pay close attention to this last layer, which is important for protecting the crops from rain.

The roof must be built 1 m above the ground. The roof must be build with a slope to one side.

**Ground surface**

The ventilation pipe must be raised 50cm above the ground. It must be painted black.

Painting the pipe black will warm the inside air and generate increased air-flow and ventilation.

Step 8

## 2.8. CONSTRUCTING THE FLOOR

1 The floor is 25 cm thick. The top 10 cm is cement. .

2 The bottom layer of the floor is gravel, 15cm thick.

3 Lay a ventilation pipe in the top 10 cm of the floor. The ventilation holes should face up.

### 3. OPERATION OF BICLIMATIC CELLAR

#### 1. How does a bioclimatic cellar operate?

- Ventilation occurs as a result of natural circulation of inside and outside air .
- Thick walls and insulated floors keeps the temperature at moderate level.

*Underground temperature throughout the year*

**2. What can be stored in bioclimatic cellar and in what temperature?**

Name of fruits and vegetables	Appropriate temperature (°C)	Relative humidity (%)	Cannot be stored together
Potato	5 to 8	85-95	
Carrot	0.5 to 1	90-95+	
Onion	0 to 3	70 -75	
Apple	3 to 4	90-95	
Beet	0 to 1	90 95	
Turnip	0 to 1	90 95+	
Cabbage	0 to 1	94 97+	
Radish	0 to 1	95+	
Persimmon	0 to 1	85-95	Apple and Persimmon
Pomegranate	> 5 to 6	90-98	Apple and Pomegranate

**3. How to freshen the air?**

For a 4 ton bioclimatic cellar, operate the ventilation pipes in the following way: From November till March open just one pipe,

- In October, April and May open all the pipes
- If the humidity inside the cellar is above 95%, it is important to open windows.

In winter, spring and summer you can regulate the temperature with ventilation.

**4. How to determine when to use ventilation?**

Here are some signs ventilation is required:

- If the crop is dry to the touch, it means temperature levels inside the cellar are high and humidity level is low.
- If the crop is moist, it means the humidity level is too high.

In such cases, you should ventilate and refresh the air inside the cellar.

## 4. CONTACT INFORMATION OF PROMOTERS AND MASTERS

	Ayni district	Asht district
For construction of bio climatic cellar, please contact:	<b>Narzulloev Barot</b> Address: Hayronbed village, Fondaryo jamoat, Phone: 92 848 77 60.	<b>Karimov Rustam</b> Address: Marhamat village, jamoat Oshoba. Phone: 92 702 82 63
To purchase construction materials, please go to:	<b>Sarvoda Construction Store</b> Address: Sarvoda town (near hospital)	<b>Uppon village market</b> Address: Upponi Bolo village, Oshoba jamoat.
